Protecting You During Your Dental Visit

For years, dental offices have taken steps to protect patients and dental health care team members against disease transmission during treatment. You may see some of these measures in the waiting area and the clinic, but many take place behind the scenes.

In the Waiting Area
Your dental office wants to keep you and other patients safe from the minute you walk in the door. Coughing and sneezing can spread germs. For that reason, you should cover your mouth and nose whenever you cough or sneeze. To help with this, many offices provide disposable masks or tissues in the waiting area and the clinic, but many take place behind the scenes.

Behind the Scenes
Rest assured, any instruments used during your treatment must be clean. Some, like the tube used to suck saliva from your mouth, are disposable.

Instruments that are not disposable must be handled carefully after every patient. After your treatment, these instruments must be taken to a special area to be washed, sorted into sets for the next use, and put in a special oven called an autoclave to expose them to high heat designed to kill germs.

Even the quality of the water used during your dental treatment must be monitored. Water from the dental unit must be the same quality as drinking water. To achieve this, a dental office may use water from a source other than the public water system or may treat the water system. Regardless of where the water comes from, your dental office must check the quality regularly.

Conclusion
Dentists work hard to keep patients safe during their visits. These are only some of the steps dentists take to reduce the risk of infection. If you have questions about infection control, ask your dentist or the dental team members.

Don’t Let Halloween Play Tricks on Your Kids’ Teeth

It’s probably safe to say that due to the coronavirus, kids in America won’t be celebrating Halloween in the traditional way this October. Even though some kids may already wear masks as part of their costumes, the increased risk of contracting COVID-19 may cause parents and communities to press pause on trick-or-treating and seek out other safer ways for kids to celebrate. That may take the form of driving the kids to only family members’ houses, ringing the doorbells of just a few close neighbors (and wiping down candy packets with antibacterial wipes), or having children trick-or-treat at home, which sounds like less fun but is one way to ensure that everyone gets their favorite candy. While this all might make you want to say “Boo!” to COVID-19, odds are a fair share of candy will still be consumed this Halloween, so Moms and Dads shouldn’t forget about the effect all that sugary stuff could have on their kids’ teeth.

While containing several pieces of candy on Halloween may not immediately be harmful to your teeth, excessive and continuous candy consumption can impact oral health. The more you eat sugary foods like candy, and the longer sugars remain in your mouth before you brush your teeth, the greater your risk for tooth decay, especially in young children. Teeth are more susceptible to decay during the first few years after eruption in the mouth. Since children are getting teeth until around age 13, their teeth are more vulnerable to decay.

You also want to be mindful of the types of candy your child is consuming. Sticky, gummy candies have the most cavity-causing potential, because these types of treats get easily stuck between teeth and orthodontic brackets, and as a result are not easily brushed away. Hard candies can also be an issue because they are consumed slowly, exposing the mouth to sugar over longer periods of time.

Parents should make sure that children brush and floss their teeth after eating candy, and shouldn’t let them go to sleep without brushing the sugary residue from their teeth.

Another piece of advice for parents is to not let Halloween treats hang around the house for too long. Parents may want to consider allowing their kids to have a few pieces of candy each day for one week and then hiding, tossing, or donating the rest.

It’s been a challenging year for everyone, especially children, but with some minor adjustments, you can let them have some Halloween fun and keep them smiling despite what’s happening outside your front door.
